Mean 9.510; Variance 7.769; scale 1.224 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DNA encoding plant citrate synthase - used to regulate flower formation, to improve storage of tubers, etc. and to reduce sprouting claim 7. Page 60-63; 87pp; English.

To identify a cDNA from tobacco which codes for citrate synthase, a cDNA bank of leaf tissue from tobacco was prepd. Plaques of this cDNA bank were screened using a radioactive DNA probe which comprises Solamm tubersum citrate synthase cDNA (104199). One of the clones was sequenced. The nt. sequence is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The potato citrate synthms (CS) gene or cDNA sequence encoding CS (103410) may be used to produce antisense CS sequences. CS DNA sequences are useful for altering CS activity in plants. Antisense CS sequences can be used to inhibit CS expression in plants and has the effect of inhibiting flower formation and by doing so improves the plant's storage capacity. This is partic. useful in crop plants of any kind but esp. useful in potatoes. In addition to altering CS activity the DNA sequences can also be used to identify similar sequences in the genomes of other plants and in the production of sequence 1891 BP; 370 C; 425 G; 584 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     29 IACAAGAACTGATTCCTGAACAACAGGAACGACTGAAGAAGAAGAAGAATTTGGAA

DNA encoding plant citrate synthase - used to regulate flower formation, to improve storage of tubers, etc. and to reduce sprouting to improve storage of tubers, etc. and to reduce sprouting to improve storage of tubers, etc. and to reduce sprouting of an expensive spring in a cDNA from potato which codes for citrate synthase, a cDNA fragment of citrate synthase from Arabidopsis thaliana was firstly amplified using A.thaliana cDNA and oligos T04.02 and T04.03 which are complementary to the 5 or 3 or of or five coding region of A. thaliana cDNA for citrate synthase. The oligos additionally introduce BamHI cleavage sites at both ends of the amplified cDNA fragment. a cDNA library was prepd. from potato leaves and screened with A. thaliana citrate synthase cDNA. Positive clones were purified and sequenced. The nt sequence is given in T04199. Sequence 1891 BP; 512 A; 370 C; 425 G; 584 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Mismatches 261; Indels 12; Gaps 10;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; p; English.

Random point mutations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are mishncorporated by the transcriptase and the molecules are completed to forms that can be amplified and them expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                             transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host vector system. The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.

Thuman tumour necrosis factor receptors 6-alpha and 6-beta - used in the diagnosis of immune system related disorder(s)

Disclosure; Fig 1: 91pp; English.

The diagnosis of immune system related disorder(s)

Disclosure; Fig 1: 91pp; English.

The invention also provides

The present sequence represents the human tumour necrosis factor

receptor-6 alpha (TNRP-6 alpha) cDNA. The invention also provides

for the TNRP-6 beta cDNA (V39086). TNRP-6 alpha and TNRP-6 beta are

members of the tumour necrosis factor receptor (TNRP) family. TNRRs

are expressed in endothelial cells, keratinocytes, normal prostate and

particularly of the immune system, substantially altered (whether increased or decreased) levels of TNRP-6 alpha and/or TNRP-6 beta gene expression can be detected, therefore the TNRP-6 alpha and TNRP-6 beta collypeptides, nucleic acids and antibodies are claimed to be useful in the diagnosis of such disorders. Mutations of the TNRP-6 alpha and TNRP-6 beta genes can also be detected. The TNRP collypeptides are claimed to be useful for identifying ligands which may be useful in the treatment of apoptosis related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                        Human tumour necrosis factor receptor-6 alpha cDNA.

It hybridized to all spp. of mycobacteria tested, but cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide probe MK14-A consists of nucleotides 5-95 of MK14 (Q51735). It hybridized to all spp. of mycobacteria tested, but cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. ```
identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain bisclosure; page 35, 255pp; English.

Old 68 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)11/TGC)(NNB)6Z(NNB)7(TGC)(NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.

Other specific peptides generated by these generic sequences are shown in R6515-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions — a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or blologically active.They may further comprise a linker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0;
                                                                                                                                                                                                                 and prevent e.g. inflammation, arthritis, septicaemia, autoimmune diseases, transplant rejection, infection, stroke, ischaemia, ARDS, restenosis, AIDS, bone disorders and cancer.

Claim 3: Fig 1: 21pp: English.

This is the nucleotide sequence of the human tumour necrosis related receptor (TR4), used in the method of the invention. The TR4 protein or its agonist can be used to treat a subject in need of enhanced TR4 polypeptide activity. The antagonist is used to inhibit TR4 polypeptide activity. The active agents can be used for the treatment and prevention of diseases such as chronic and acute inflammation, arthritis, septicaemia, autoimmune diseases, transplant rejection, stroke, cancer, Alzheimer's disease.

resols notifying proteins or peptide(s) which bind a ligand - by
recombinant vector library expressing fusion proteins
comprising a recombinant vector library expressing fusion proteins
comprising a binding domain and an effector domain
Disclosure; Page 35; 255pp; English.

70765 is a generic DNA sequence used to generate random TSAR (Totally
Synthetic Affinity Respents) peptides. This generic formula can also be
represented as follows: X(NNB)6 (TGC)(NNB)12 (NNB)14 (TGC)(NNB)3Y. X
and Y are flanking restriction sites (X is not the same as Y) that are
not specified further. Other generic sequences are shown in
R65151-54. TSARs are concatenated heterofunctional proteins or peptides,
comprising at least two functional regions - a binding domain with
R65151-54. TSARs are concatenated heterofunctional proteins or peptides,
comprising at least two functional regions - a binding domain with
chemically or biologically active. They may further comprise a linker
peptide between the 2 domains. The oligonuclectides are also designed so
that the expressed peptide contains. 2 or 4 cysteine residues positioned
in, or flanking, the unpredicted or variant residues. These residues
confer some degree of conformational rigidity to the peptides. The TSARs
correct comprising a TSAR binding domain can be used in vivo to
deliver a chemically or biologically active moiety, eg. metal ion,
radioisotope, peptide, toxin or enzyme, to the specific target or on the
                  that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                          0
peptide between the 2 domains. The oligonucleotides are also designed so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       412 IIGGAIGAGCCGTAAIAGGIAGAGCAICAAIIGIIIIGIACACAIGGICIGGGAIAGAAG 353

This is the nucleotide sequence of the clone CH377], used in the method of the invention involving secreted proteins from human cells potentially useful as immuno-modulators, anti-tumour agents, itssue growth promoters, haemostatic and thrombolytic agents. It was isolated from an adult human testes cDNA library. They may be used to express the recombinant protein, as tissue/molecular weight markers, for chromosome identification, to identify possible genetic disorders and isolate new related DNA, as sources of primers for PCR, to generate anti-PDR anti-DNA antibodies, or in interaction trap assays to identify sequences that encode interacting proteins.

Screen for agonists and antagonists of G protein interaction claim 1: Page 29; 40pp English.

CDNA clones (14769-75) respectively code for human G protein submara.2, gamma-2, gamma-7, gamma-7, gamma-10 and gamma-11 subunits (W09412-18). Several human cDNA libraries were partially sequenced to identify expressed sequence tags (EST). By matching sequences of EST to genes of known structure, the 7 new subunit sequences of EST to genes of known structure, the 7 new subunit has been deposited as APCC 97139. The cDNA clone for gamma-11 has been deposited as APCC 97139. The isolated cDNA clones can be used to horduce recombinant gamma subunits in prokaryotic or eukaryotic host cells for use in the development of therapeutic and diagnostic

```

```
CC 2 cDNA clones (T58281 and T58282) respectively code for the STZ (W01604) and STO (W01605) polypeptides of Arabidopsis thaliana. CC They were isolated by using clones of an A. thaliana cDNA library CC to transform yeast strains that lacked active calcineurin CC salt than wild-type strains). Clones that complemented the salt CC stl than wild-type strains). Clones that complemented the salt corp have the ability to confer salt tolerance analysis. STZ and CC fungi and other organisms. Recombinant expression cassettes incorporating the STZ or STO sequence can be used to produce CC transgenic plants able to grow under saline conditions. Sequence 940 BP; 289 A; 235 C; 186 G; 230 T;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 8.940; Variance 5.499; scale 1.626
